Leeds, UK | jadentellis03@gmail.com | jaden-tellis.vercel.app | linkedin.com/in/jaden-tellis
github.com/jadentel

Education

University of Leeds, MEng/BSc in Computer Science Sept 2022 – Present

- **Courses:** Machine Learning, Deep Learning, Artificial Intelligence, Advanced Software Engineering, Data Science, Algorithms.

Experience

Software Engineer Intern, Leaning Technologies – Leeds, UK October 2024 – Present

- Contributed to developer-facing web platforms supporting product education and adoption
- Assisted in the technical organisation of hackathons, including setup, documentation, and participant support
- Maintained developer support workflows through Discord moderation and issue resolution
- Gathered and analysed developer feedback from community channels to inform improvements to tooling and documentation

WebVM Hackathon II, Leaning Technologies – Leeds, UK 2024

- Built a browser-based Linux environment using CheerpX and xterm.js, providing an interactive terminal with a persistent filesystem
- Developed a responsive frontend with Next.js and Tailwind CSS, featuring a split interface for terminal interaction and AI assistance
- Integrated the Claude API to deliver real-time command guidance and contextual help within the terminal
- Awarded 3rd place for technical implementation and overall project quality

Projects

Forza - Full-Stack Fitness Tracking Platform github.com/jadentel

- Developed a full-stack web application for analysing and visualising GPS fitness activity data
- Designed and implemented a RESTful backend using Flask and SQLite, focusing on secure and scalable data handling
- Built a responsive and interactive frontend with Next.js to improve usability and accessibility
- Containerised the application using Docker to streamline deployment and environment consistency
- Applied Agile practices including sprint planning and retrospectives to guide iterative development
- Maintained version control and collaboration workflows using GitHub

Protein Folding Prediction - Dissertation

- Developed a Genetic Algorithm enhanced with Bayesian Optimisation to predict protein folding pathways
- Increased conformational diversity by up to **100%** and reduced fitness evaluations by up to **90%** on medium-length sequences
- Outperformed standard GA and Monte Carlo benchmarks in accuracy and efficiency across sequences of lengths 20–64
- Built a modular Python framework with automated evaluation, supporting future hybrid or ML-guided improvements

Technologies

Languages: C++, C#, Java, Python, JavaScript, TypeScript, SQL, HTML/CSS, Dart

Frameworks / Libraries: React, Next.js, Tailwind CSS, Flask, Django, Flutter, SpringBoot, SQLite, Supabase

Tools / Platforms: Docker, Git/GitHub, Linux CLI, CI/CD / Agile/Scrum
